

STATUS OF THESIS

Title of thesis Activity Study of Cu based Catalytic Matrixes with ZnO and/or ZrO<sub>2</sub> for Enhancement of Catalyst Active Lifetime and Methanol Yield

I JASVINDER SINGH GILL

hereby allow my thesis to be placed at the Information Resource Center (IRC) of Universiti Teknologi PETRONAS (UTP) with the following conditions:

1. The thesis becomes the property of UTP
2. The IRC of UTP may make copies of the thesis for academic purposes only.
3. This thesis is classified as

Confidential

Non-confidential

If this thesis is confidential, please state the reason:

## ACKNOWLEDGEMENTS

Foremost, I would like to thank my supervisor, Prof. Dr. Vladimir Piven for his guidance throughout the period of my MSc study. I am grateful also to Dr. Chandra Mohan for his advice and assistance whenever one is needed.

I am thankful also to my research mate, Saidolim for his help and also for being candid with his opinions.

I would also like to thank the technicians, Mr. Hasnizam , Ms.NorAzimah, Mr. Fazli, and Mr. Firdaus from the Chemical Engineering Department as well as Mr.Anuar, Mr.Faisal, Mr.Irwan and Mr. Omar from the Mechanical Engineering Department of UTP for providing assistance with the analytical equipments.

On a personal note, I am grateful to my family and friends for their continuous encouragement and help.

## ABSTRACT

A series of Cu/ZnO/Al<sub>2</sub>O<sub>3</sub>, Cu/ZnO/ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> and Cu/ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> catalysts were prepared for methanol synthesis study in Lurgi process. Apart from Cu and Al<sub>2</sub>O<sub>3</sub>, these catalysts would contain ZnO and/or ZrO<sub>2</sub> as active Carbon monoxide (CO) hydrogenation sites. The preparation method was an alternative acid-alkali pH precipitation. The SEM-EDX data for the formulations with various atomic ratios showed high homogeneity, hence good intermixing of ingredients. TPR analysis was done on all prepared matrixes and industrial catalyst and showed the reduction temperature of 300 °C to 345 °C for all 3 types of catalysts prepared. Both Low and High Temperature peak obtained for Metal Surface Area (MSA) analysis showed that there is a general decreasing H<sub>2</sub> adsorption trend with the increasing amount of Zirconia in the catalyst. Prepared catalyst sample A with no zirconia present showed highest low and High Temperature adsorption in comparison with commercial and prepared catalysts. This suggests that Cu-ZnO catalyst have higher activity as compared to Cu-Zirconia based catalysts. TGA analysis also reveals that prepared catalysts sample has higher thermal stability at Lurgi Operating Temperature of 250°C compared to Industrial catalysts sample. CO conversion study reveals that sample A with no Zr present has highest conversion of up to 4%. Also determined was that Zn offers higher activity in CO hydrogenation process in catalyst samples compared to Zr when present in the same atomic %. Also monoclinic Zr phase formed in catalyst type Cu/ZnO/ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> gives higher MeOH Yield compared to catalyst sample where tetragonal Zr phase is formed. A consistent trend between CH<sub>4</sub> formation during activity study and Carbon formation study by CHNS reveals the most likely route for Carbon formation was through CH<sub>4</sub> decomposition to form Carbon on catalysts surface sample. The analytical kinetic study conducted decided that coverage of O atoms should be 0.5 in the beginning of the reaction in order to maximize the initial rate of reaction..

## ABSTRAK

Sekumpulan pemangkin yang mengandungi komposisi Cu/ZnO/Al<sub>2</sub>O<sub>3</sub>, Cu/ZnO/ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> and Cu/ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> telah disediakan untuk mengkaji penghasilan Methanol melalui proses Lurgi. Selain Cu dan Al<sub>2</sub>O<sub>3</sub>, kelas pemangkin ini juga megandungi ZnO dan/atau ZrO<sub>2</sub> sebagai tapak penghidrogenan Karbon monoxida (CO). Kaedah yang digunakan untuk penyediaan pemangkin adalah kaedah pemendakkan melalui penyelangan asid-alkali. Data SEM-EDX untuk semua pemangkin menunjukkan penaburan logam sama rata di permukaan pemangin. Analisis TPR untuk semua pemangkin serta pemangkin industri menunjukkan suhu penurunan dalam kategori 300 °C hingga 345 °C. Kedua-dua puncak Suhu rendah dan Tinggi yang dari analisis Luas Permukaan Logam menunjukkan penerapan H<sub>2</sub> yang berkurangan jika nisbah logam Zr dalam pemangkin meningkat. Pemangkin berlabel A yang tidak mengandungi Zr menunjukkan penerapan Suhu rendah dan Tinggi yang lebih tinggi berbanding pemangkin lain. Ini menunjukkan bahawa pemangkin jenis Cu-ZnO mempunyai aktiviti yang lebih tinggi berbanding pemangkin jenis Cu-Zirkonia. Analisis TGA juga menunjukkan pemangkin yang dihasilkan mempunyai daya stabil suhu yang lebih tinggi pada suhu operasi proses Lurgi iaitu 250°C berbanding pemangkin industri. Penyelidikan penukar-prosesan CO menunjukkan pemangkin berlabel A yang tidak mempunyai Zr mencapai penukar-prosesan paling tinggi sebanyak 4%. Ia juga telah ditentukan bahawa pemangkin yang mengandungi Zn membolehkan pencapaian aktiviti lebih tinggi bilih berbanding pemangkin yang mempunyai Zr dalam nisbah % yang sama. Juga fasa monoklinik untuk logam Zr dalam pemangkin jenis Cu/ZnO/ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> menghasilkan jumlah MeOH yang lebih tinggi berbanding fasa jenis tetragonal untuk logam Zr. Trend konsisten di antara penghasilan CH<sub>4</sub> semasa penyelidikan aktiviti dan penyelidikan penghasilan Karbon melalui analisis CHNS menunjukkan kaedah nyahkomposisi CH<sub>4</sub> sebagai Jalan penghasilan karbon di permukaan pemangkin. Penyelidikan kinetic

analitikal juga menunjukkan nisbah O di permukaan pemnagkin harus 0.5 untuk mencapai aktiviti maksimum pada permulaan tindakbalas.

## LIST OF SYMBOLS

$\alpha$ -alumina	-	Alpha type Alumina
$\gamma$ -alumina	-	Gamma type Alumina
$\theta$ -alumina	-	Theta type Alumina
$\delta$ -alumina	-	Delta type Alumina
Cu	-	Copper atom
Zn	-	Zinc Atom
Al	-	Alumina Atom
Zr	-	Zirconia Atom
Å	-	Angstrom unit ( $10^{-10}$ m)
$\theta$	-	Reflection/diffraction angle, °
$\lambda$	-	Wavelength radiation (nm)
mV	-	miliVolt
keV	-	kiloelectroVolt
R	-	Ideal gas constant, 8.314 J/mol.K
T	-	Temperature, °C
P	-	Pressure, bar
MSA	-	Metal Surface area, m <sup>2</sup> /g
$N_A$	-	Avogadro's number, $6.022 \times 10^{23}$
Mol H <sub>2</sub>	-	moles of hydrogen consumed per unit mass catalyst, $\mu\text{mol}_{\text{H}_2}/\text{gcat}$
$c_m$	-	No. of surface Cu atoms per unit area, $1.47 \times 10^{19}$ atoms/m <sup>2</sup>
S.F	-	Stoichiometric factor, 2
$W_{\text{Cu}}$	-	Cu metal content, wt%
$MW_{\text{Cu}}$	-	Cu molecular weight.
$\phi_{av}$	-	average copper particle size
$\rho$	-	Density, cm <sup>3</sup> /g

$D_{Cu}$	-	Copper Dispersion, %
$X_{CO}$	-	Conversion of CO, %
$(n_x)^i$	-	Content of molecule X feed stream, mol %
$(n_x)^f$	-	Content of molecule X in the outlet stream, mol %
$S_x$	-	Selectivity of product X, %
$g_{cat}$	-	Catalyst mass, g
$x$ - M	-	Molecule X adsorbed on metal (Zn or Zr) surface
$M^*$	-	Free metal(Zn or Zr site)
$\theta_x$	-	coverage of molecule X on metal (Zn or Zr) surface ( $x=V$ means vacant sites )
$k_i$	-	forward reaction rate constant for reaction i
$K_i$	-	Equilibrium reaction rate constant. $K_i=k_i/k_{-i}$
$P_A$	-	Pressure of gas A in the system ( $P_A=P_A/P^0$ ). $P^0$ is the reference pressure at STP
$r_i$	-	Rate of Reaction for reaction i. ( $r_i=r_{+i}-r_{-i}$ )

## LIST OF ABBREVIATIONS

Syngas		Synthesis gas
CO	-	Carbon monoxide
CO <sub>2</sub>	-	Carbon dioxide
H <sub>2</sub>	-	Hydrogen
MeOH	-	Methanol
DME	-	Dimethyl ether
MF	-	Methyl Formate
CH <sub>4</sub>	-	Methane
N <sub>2</sub>	-	Nitrogen
N <sub>2</sub> O	-	Nitrous Oxide
XRD	-	X-ray diffraction
s-TPR	-	Surface Temperature-programmed reduction
TPR	-	Temperature-programmed reduction
TGA	-	Thermal Gravimetric Analysis
FESEM	-	Field Emission Scanning electron microscopy
EDX	-	Energy-dispersive x-ray
CHNS	-	Carbon, Hydrogen, Nitrogen and Sulfur Analyser
STP	-	Standard temperature and pressure
WHSV	-	Weight hourly space velocity
GC	-	Gas chromatography
FID	-	Flame ionization detector
TCD	-	Thermal conductivity detector
MOX	-	Malaysia Oxygen Berhad
