Date: 21 January 2010 .

DEDICATION

This thesis is especially dedicated to my beloved family.....

ACKNOWLEDGEMENTS

In the name of Allah, the Most Beneficent and the Most Merciful. I am indeed grateful to Him for guiding me on the right path and giving me the opportunity to study with strength, endurance and patience to complete this PhD study.

My sincere thank goes to my main supervisor, Assoc. Prof. Dr Suzana Yusup and co-supervisor Assoc. Prof. Dr Azmi Mohd Shariff for their guidance and support. Many thanks to Universiti Teknologi PETRONAS (UTP) for the scholarship and lab facilities, Ministry of Science Technology and Innovation (MOSTI) for the E-science research fund (Project No. 03-02-02-SF0020) as well as Assoc. Prof. Dr Fakhru'l Razi Ahmadun from Universiti Putra Malaysia (UPM) and Dr Gavin Walker from University of Nottingham, UK for giving me an opportunity to do collaboration work.

Not to forget, my gratitude to my research colleagues at UPM and University of Nottingham for helping me in initial lab work as well as the UTP Chemical and Mechanical Eng lab technologists for their kind assistance in samples' characterizations. My appreciation to Dr Shuhaimi Mahadzir (Chemical Engineering Program Head), Assoc. Prof. Dr M Ibrahim A Mutalib (ex-Director of REO), Chemical Engineering colleagues and my friends for their endless moral support. Also thanks to UTP support staff especially Human Resource Management, Finance Fund & Management, Research Enterprise Office and Postgraduate Studies for their co-operation throughout my PhD journey.

Most of all, to my husband Zuhairi Hj Baharudin, who is also finishing his doctoral study, thank you for your unconditional love, sharing pains with me and lightening burdens on me. To my lovely children, 5-year-old Nur Afiqah and 3-year-old Muhammad Syahmi, thank you for adding beautiful colors in my life. May Allah bless and protect them. Special thanks to my mother Hajah Hasnah Hassan, mother-in-law Hajah Timah Soman and father Hj Sufian Kulob Ismail for their continuous prayers and encouragement. May Allah bless and reward them. Last but not least, to my late father-in-law Allahyarham Hj Baharudin Sidik, may Allah bless his soul in peace and place his soul among the righteous in the Hereafter.

ABSTRACT

This research work focuses on the development of carbon nanomaterial particularly graphitic nanofibers by using chemical vapour deposition method. In addition, the development of catalyst for the synthesis of graphitic nanofibers has been investigated. For optimization of experimental parameters, Taguchi method has been used as the design of experiment. The capacity of the developed materials in hydrogen adsorption is tested at 77 K, 20 bar and 298 K, 100 bar using gravimetric measurement technique.

For graphitic nanofiber (GNF) development, the preliminary experiments show that the most optimum temperature to produce the highest yield for both iron- and nickel-based GNF samples is 600°C. Other controlled parameters are not significant except for C₂H₄/H₂ flow rate in nickel-based GNF samples synthesis where the maximum flow ratio (90/10) provides the highest yield in the reaction. In the GNF development, the modified experiment has improved the GNF yield from 6.4 to 12.1 g/(g_{cat}·hr) in iron-based GNF samples and from 32.9 to 60.2 g/(g_{cat}·hr) in nickel-based GNF samples. In additions, the optimum conditions to synthesize the highest yield of carbon nanotube (CNT) is when CNTs are produced in the reaction time of 40 minutes, H₂ flow rate of 300 ml/min and the catalyst weight of 0.2 g using benzene as the carbon feedstock.

The sample characterization using scanning electron microscope (SEM) and field emission scanning electron microscope (FESEM) has found that the average diameter size of CNTs varies from 90 to 210 nm and GNF varies from 100 to 200 nm. The use of transmission electron microscope (TEM) has proved that all CNTs are consist of multiwall nanotubes (MWNTs) while GNFs comprises of platelet and herringbone structures. Further characterization was done using Raman spectroscopy to obtain the purity of the sample by determining the relative value of amorphous carbon over graphite and the degree of graphitization. For the purpose of hydrogen adsorption study, the specific BET surface area of each sample is determined by surface area analyzer. The specific BET surface area of developed CNTs and GNFs are in the range of 51 to 121 m²/g and 60 to 293 m²/g, respectively.

For hydrogen adsorption studies at 77 K and 20 bar conditions, the capacities using the developed GNFs are found to be between 0.58–0.64 wt% while at 150 bar, the weight percentage of the adsorbed hydrogen using GNFs is ranging from 0.06–0.30 wt% and at 100 bar, the capacities ranging from 0.07–0.27 wt%. The method used for adsorption studies focused on gravimetric measurement technique because of its high accuracy and less amount of sample is required as an adsorbent as compared with the conventional method that is the volumetric measurement.

The experimental results also show that it is quite complex to realize the target of 6.5 wt% set by Department of Energy, USA either at 77 K or 298 K. Improvements in the development of CNTs and GNFs for hydrogen storage is a challenging task. Controlling the pore size distribution to be less than 1 nm and the micropore volume to be sufficient in enabling more hydrogen molecules to be stored are among the challenges. The presence of more open pores rather than close pores and tube encapsulation is very crucial.

ABSTRAK

Kerja penyelidikan ini memfokuskan pada penghasilan karbon nanobahan terutama nanofiber grafit (GNF) dengan menggunakan kaedah enapan wap kimia. Tambahan pula, penghasilan mangkin untuk sintesis GNF juga diselidiki. Untuk pengoptimuman parameter eksperimen, kaedah Taguchi telah digunakan sebagai reka bentuk eksperimen. Kapisiti penghasilan bahan untuk penyerapan hidrogen telah diuji pada 77 K, 20 bar dan 298 K, 100 bar dengan menggunakan teknik pengukuran melalui gravimetri.

Untuk penghasilan GNF, peringkat awal eksperimen menunjukkan suhu yang paling optimum untuk memperolehi pengeluaran yang tinggi untuk kedua-dua sample GNF yang dihasilkan berdasarkan besi dan nikel (sebagai mangkin) ialah 600°C. Kawalan parameter-parameter yang lain adalah tidak penting kecuali kadar aliran CH_4/H_2 dalam sintesis sample GNF berdasarkan nikel di mana kadar aliran maksimum (90/10) menghasilkan pengeluaran tertinggi dalam tindakbalas tersebut. Dalam penghasilan GNF, pengubahsuaian eksperimen telah meningkatkan pengeluaran GNF daripada 6.4 kepada 12.1 g/(g_{mangkin}·j) untuk sampel GNF berdasarkan besi dan daripada 32.9 hingga 60.2 g/(g_{mangkin}·j) untuk sampel GNF berdasarkan nikel. Tambahan, keadaan yang optimum untuk mensintesis pengeluaran nanotub karbon (CNT) yang tinggi ialah apabila CNT dihasilkan dalam masa tindakbalas selama 40 minit, kadar aliran hydrogen sebanyak 300 ml/min dan jisim mangkin sejumlah 0.2 g dengan menggunakan benzin sebagai sumber karbon.

Pencirian sampel menggunakan mikroskop imbasan electron (SEM) dan mikroskop imbasan electron medan pencahayaan (FESEM) menunjukkan bahawa purata saiz diameter CNT ialah di antara 90 hingga 210 nm manakala untuk GNF ialah di antara 100-200 nm. Penggunaan mikroskop pancaran electron (TEM) menunjukkan bahawa semua CNT mengandungi nanotub berbilang dinding (MWNT) manakala GNF terdiri daripada struktur tersusun (*platelet/stacked*) dan struktur tulang ikan (*herringbone/fishbone*). Pencirian selanjutnya dijalankan menggunakan spektroskopi Raman untuk memperolehi ketulenan sampel dengan mengira nilai relatif karbon amorfus kepada grafit dan tahap grafitisasi. Untuk

tujuan pengkajian penjerapan hidrogen, luas permukaan BET tertentu untuk setiap sampel dinilai oleh penganalisa luas permukaan. Luas permukaan BET tertentu untuk CNT dan GNF adalah masing-masing dalam lingkungan 51 hingga 121 m²/g dan 60 hingga 293 m²/g.

Untuk kajian penjerapan hydrogen pada keadaan 77 K dan 20 bar, kapasiti yang terhasil dengan menggunakan GNF yang dihasilkan didapati terhasil di antara 0.58–0.64 wt% manakala pada 150 bar, peratus berat hidrogen yang terjerap dalam GNF adalah di antara 0.06–0.30 wt% dan pada 100 bar, kapasiti tersebut adalah di antara 0.07–0.27 wt%. Kaedah kajian penjerapan memfokuskan kepada teknik pengukuran melalui gravimetri kerana kejituan pengukuran adalah tinggi dan sedikit sampel diperlukan berbanding dengan kaedah lama yang terdahulu iaitu pengukuran melalui isipadu.

Keputusan ujikaji menunjukkan bahawa adalah sukar untuk merealisasikan sasaran iaitu 6.5 wt% seperti yang telah ditetapkan oleh Jabatan Tenaga, Amerika Syarikat sama ada pada 77 K atau 298 K. Pengubahsuaian penghasilan CNT dan GNF untuk penyimpanan hidrogen adalah satu tugas yang mencabar. Pengawalan taburan saiz liang untuk kurang daripada 1 nm dan keberkesanan isipadu liang mikro untuk menyimpan molekul hidrogen adalah sebahagian daripada cabaran-cabaran tersebut. Kehadiran lebih banyak liang terbuka berbanding liang tertutup dan enkapsulasi tiub adalah sangat genting.

Figure 5.13	TEM images with magnification of 165,000X show a significant change of NiO particles size that calcined at (a)low; and (b)high temperatures.....	117
Figure 5.14	The effect of temperature, time and salt weight on the reaction yield.....	119
Figure 5.15	The effect of (a)reaction time, (b)C ₂ H ₄ /H ₂ flow rate; and (c)temperature on the samples FG yield	123
Figure 5.16	The effect of (a)reaction time, (b)C ₂ H ₄ /H ₂ flow rate and (c)temperature on the samples NG yield.....	123
Figure 5.17	Interaction severity index of GNF yields in (a)samples FG and (b)samples NG.....	124
Figure 5.18	Interaction between reaction time and C ₂ H ₄ /H ₂ flow rate.....	125
Figure 5.19	Hydrogen flow rate reading with respect of the flowmeter scale of the modified experimental set up.....	127
Figure 5.20	(a)The ceramic boat contained developed GNFs is taken out from the tube reactor; and (b)the developed GNFs are produced along the ceramic boat.....	127
Figure 5.21	The effect of (a)reaction time, (b)C ₂ H ₄ /H ₂ flow rate and (c)temperature on the samples LFe yield.....	129
Figure 5.22	The effect of (a)reaction time, (b)C ₂ H ₄ /H ₂ flow rate and (c)temperature on the samples LNi yield.....	130
Figure 5.23	Interaction severity index of GNF yields in (a)samples LFe and (b)samples LNi.....	130
Figure 5.24	Interaction between (a)reaction time and C ₂ H ₄ /H ₂ flow rate in samples LFe reaction yield and (b)C ₂ H ₄ /H ₂ flow rate and reaction temperature in samples LNi reaction yield.....	131
Figure 5.25	XRD pattern of GNF with Fe ₂ O ₃ as the catalyst.....	132
Figure 5.26	XRD pattern of GNF with NiO as the catalyst.....	133
Figure 5.27	Comparison of XRD patterns of samples FG based on reaction time.....	134
Figure 5.28	Comparison of XRD patterns of samples NG based on reaction time.....	135

Figure 5.29	Comparison of XRD patterns of samples FG based on C ₂ H ₄ /H ₂ flow rate.....	136
Figure 5.30	Comparison of XRD patterns of samples NG based on C ₂ H ₄ /H ₂ flow rate.....	137
Figure 5.31	Comparison of XRD patterns of samples FG based on temperature..	138
Figure 5.32	Comparison of XRD patterns of samples NG based on reaction temperature.....	139
Figure 5.33	Comparison of XRD patterns of sample LFe based on reaction time.....	140
Figure 5.34	Comparison of XRD patterns of samples LNi based on reaction time.....	141
Figure 5.35	Comparison of XRD patterns of samples LFe based on C ₂ H ₄ /H ₂ flow rate.....	142
Figure 5.36	Comparison of XRD patterns of samples LNi based on C ₂ H ₄ /H ₂ flow rate.....	143
Figure 5.37	Comparison of XRD patterns of samples LFe based on reaction temperature.....	144
Figure 5.38	Comparison of XRD patterns of samples LNi based on reaction temperature.....	145
Figure 5.39	Raman spectra of samples FG based on reaction temperature.....	146
Figure 5.40	Raman spectra of samples NG based on reaction temperature.....	147
Figure 5.41	Raman spectra of samples LFe based on reaction temperature.....	149
Figure 5.42	Raman spectra of samples LNi based on reaction temperature.....	149
Figure 5.43	SEM images show the significant difference between iron-based catalysts GNF (sample 2FG) at (a)low magnification of 5000X; (b)high magnification of 20000X and nickel-based catalysts GNF (sample 8NG) at (c)low magnification of 5861X; (d)high magnification of 23443X.....	151
Figure 5.44	GNFs can be (a)partially developed at 500°C and 2 hours as in L1Fe or; (b)fully developed at 700°C and 4 hours as in L7Fe.....	152
Figure 5.45	The FESEM imaging shows (a)platelet structure in L ₃ Fe; and (b)herringbone structure in L ₄ Ni.....	152
Figure 5.46	Some samples exist in almost consistent diameter size of GNFs as in samples (a)L ₈ Fe and (b)L ₁ Ni, while others exist in different diameter sizes of GNFs as in samples (c)L ₉ Fe and (d)L ₆ Ni.....	153
Figure 5.47	TEM images showing sample L ₄ Fe with (a) herringbone and (b) platelet structures; as well as (c)sample L ₁ N with hollow GNF platelet structure.....	154

Figure 5.48	Bright field TEM images of (a)sample 8FG at 500°C, (b)sample 2FG at 600°C; and (c)sample 7FG at 700°C.....	155
Figure 5.49	Bright field TEM images of (a)sample 1NG at 500°C, (b)sample 4NG at 600°C; and (c)sample 5NG at 700°C.....	156
Figure 5.50	Bright field TEM images of (a)sample L1Fe at 500°C, (b)sample L ₃ Fe at 600°C; and (c)sample L ₅ Fe at 700°C.....	157
Figure 5.51	Bright field TEM images of (a)sample L1Ni at 500°C, (b)sample L4Ni at 600°C; and (c)sample L7Ni at 700°C.....	158
Figure 5.52	Various GNF structures that is (a) coiled in L4Fe, (b)spring in L4Fe; and (c)regular helical in 6FG.....	158
Figure 5.53	The bright field TEM of GNF (a)platelet structure with its (b)corresponding SAED pattern; and (c)herringbone structures with its (d)corresponding SAED pattern.....	159
Figure 5.54	The bright field TEM of encapsulated GNF (a)platelet structure with its (b)corresponding SAED pattern; and (c)herringbone structures with its (d)corresponding SAED pattern.....	161
Figure 5.55	SEM image shows the tip growth of Sample 3NG on NiO catalyst in three directions.....	162
Figure 5.56	TEM image shows the tip growth of 4FG on Fe ₂ O ₃ catalyst (the dark spot) in two directions.....	163
Figure 5.57	Formation of corrugated shape of CNF.....	164
Figure 5.58	Both GNFs (labeled as ‘Y’) and C-CNFs (labeled as ‘X’) are produced in samples produced during (a)preliminary experiment; and (b)modified experiment.....	164
Figure 5.59	More C-CNFs at different sizes formed in (a)1NG sample (more than 100 nm); and (b)L5Ni sample (less than 100 nm).....	165
Figure 5.60	Both thin tubular fiber (labeled as ‘A’) and corrugated fiber (labeled as ‘B’) are produced in sample 7FG.....	165
Figure 5.61	The diameter size distribution of samples (a)1FG, (b)2FG, (c)3FG and (d)4FG at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	166
Figure 5.62	The diameter size distribution of samples (a)5FG, (b)6FG, (c)7FG, (d)8FG and (e)9FG at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	167
Figure 5.63	The diameter size distribution of samples (a)1NG, (b)2NG, (c)3NG, (d)4NG, (e)5NG and (f)6NG at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	168

Figure 5.64	The diameter size distribution of samples (a)7NG, (b)8NG and (c)9NG at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	169
Figure 5.65	The diameter size distribution of samples (a)L ₁ Fe, (b)L ₂ Fe, (c)L ₃ Fe and (d)L ₄ Fe at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	170
Figure 5.66	The diameter size distribution of samples (a)L ₅ Fe, (b)L ₆ Fe, (c)L ₇ Fe, (d)L ₈ Fe and (e)L ₉ Fe at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	171
Figure 5.67	The diameter size distribution of samples (a)L ₁ Ni, (b)L ₂ Ni, (c)L ₃ Ni and (d)L ₄ Ni at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	172
Figure 5.68	The diameter size distribution of samples (a)L ₅ Ni, (b)L ₆ Ni, (c)L ₇ Ni, (d)L ₈ Ni and (e)L ₉ Ni at different reaction time, C ₂ H ₄ /H ₂ flow rate and reaction temperature.....	173
Figure 5.69	N ₂ isotherm at 77 K with adsorption-desorption hysteresis of sample 4NG.....	175
Figure 5.70	N ₂ isotherm at 77 K with adsorption-desorption hysteresis of sample 9FG.....	175
Figure 5.71	The effect of reaction time, C ₂ H ₄ /H ₂ flow rate and temperature on the specific BET surface area of samples FG.....	176
Figure 5.72	The effect of reaction time, C ₂ H ₄ /H ₂ flow rate and temperature on the specific BET surface area of samples NG.....	177
Figure 5.73	The effect of reaction time, C ₂ H ₄ /H ₂ flow rate and temperature on the specific BET surface area of samples LFe.....	177
Figure 5.74	The effect of reaction time, C ₂ H ₄ /H ₂ flow rate and temperature on BET surface area of samples LNi.....	178
Figure 5.75	Pore size distribution of samples (a)iron-based GNF; and (b)nickel-based GNF in preliminary experiment.....	179
Figure 5.76	Pore size distribution of samples (a)iron-based GNF; and (b)nickel-based GNF in modified experiment.....	180
Figure 5.77	Diffraction line of (0 0 2) corresponds to the graphite crystallite.....	184
Figure 5.78	The <i>G</i> band of Raman spectra in sample 5R has more intensity than <i>D</i> band as compared with sample 1R.....	186
Figure 5.79	HRTEM images of (a)good crystallization of MWNT with thickness wall 5 nm in sample 6R; and (b)internal tube defect of MWNT in sample 1R as highlighted in the dashed circle line	187
Figure 5.80	MWNTs with (a)varies sizes of long tubes; (b)spring shape; (c)regular helical shape; and (d)coiled shape tubes	188

Figure 5.81	Comparison between thin hollow core with many multiwalls (A) and thick hollow core with few multiwalls (B)	189
Figure 5.82	Carbon nano-anion is observed in CNT development	189
Figure 5.83	A HRTEM image shows the occurrence of several catalyst inclusions (dark area) in the growing nanotubes and the inset magnifies the catalyst confined in the tube	190
Figure 5.84	HRTEM image of MWNT with an inset image of FFT view	190
Figure 5.85	Diameter size distribution and average size of samples 1R, 2R and 3R.....	192
Figure 5.86	Diameter size distribution and average size of samples 4R, 5R and 6R.....	193
Figure 5.87	Diameter size distribution and average size of samples 7R, 8R and 9R.....	194
Figure 5.88	SEM images of Sample 1R to 6R at a magnification of 10000X.....	195
Figure 5.89	SEM images of Sample 7R to 9R at a magnification of 10000X.....	196
Figure 5.90	Isotherm curve of N ₂ adsorption onto CNT sample at 77 K.....	198
Figure 5.91	The effect of reaction time, hydrogen flow rate and amount of catalyst on the specific BET surface area	199
Figure 6.1	Hydrogen adsorption-desorption hysteresis of (a)iron-based; and (b) nickel-based GNFs at 77 K using IGA.....	205
Figure 6.2	Comparison of hydrogen uptake using developed GNFs and commercial SWNT at 77 K.....	206
Figure 6.3	Hydrogen adsorption-desorption hysteresis of (a) iron-based; and (b) nickel-based GNFs at 298 K and 150 bar using MSB.....	208
Figure 6.4	Comparison of hydrogen uptake using developed GNFs at 298 K at different micropore area (m ² /g) and micropore volume (cm ³ /g)..	210
Figure 6.5	Hydrogen adsorption-desorption hysteresis of samples (a)L6Ni; (b)4NG; (c)L7Fe; and (d)L5Fe at 298 K and 100 bar using MSB with filled symbols as adsorption and open symbols as desorption..	211
Figure 6.6	Comparison of hydrogen uptake using developed GNFs at 298 K at different BET specific surface area (m ² /g).....	212
Figure 6.7	Stepped isotherm curve corresponds to hydrogen molecules adsorbed onto the carbon surface.....	213
Figure 6.8	Model development of hydrogen isotherm at 77 K using Neuro-fuzzy at surface areas of 248 and 407 m ² /g (filled symbols) as well as model validation of hydrogen isotherm at surface area of 293 m ² /g (open symbols).....	215

Figure 6.9	Model development of hydrogen isotherm at 298 K using Neuro-fuzzy at surface areas of 110 and 250 m ² /g (filled symbols) as well as model validation of hydrogen isotherm at surface areas of 147 and 293 m ² /g (open symbols).....	217
Figure 6.10	A linear plot of 1/ <i>q</i> versus 1/ <i>P_i</i> to obtain number of adsorption active site.....	218

Nomenclature

AC	Activated carbon
ANOVA	Analysis of variance
bc-MWNT	Bamboo concentric multiwall nanotube
BET	Brunauer-Emmett-Teller
bh-MWNT	Bamboo herringbone multiwall nanotube
CCD	Charged couple device
C-CNFs	Corrugated carbon nanofibers
CCVD	Catalytic chemical vapor deposition
c-MWNT	Concentric multiwall nanotube
CNF	Carbon nanofiber
CNO	Carbon nano-onion
CNT	Carbon nanotube
CVD	Chemical vapour deposition
CW	Continuous wave
DFT	Density functional theory
DoE	Department of Energy (of USA)
DOE	Design of experiment
DWNT	Double-wall nanotube
EM	Electron microscope
EOS	Equation of state
ESEM	Environmental scanning electron microscope
FC-CVD	Floating catalyst chemical vapor deposition
FDW	Fuzzy Design Wizard
FESEM	Field emission scanning electron microscope
FET	Field-effect-transistor
FFT	Fast Fourier Transform
FWHM	Full width at half maximum
GDP	Gross domestic product
GHP	Hydrophilic polypropylene membrane
GmbH	Gesellschaft mit beschränkter Haftung (a legal entity in Germany)
GNF	Graphitic nanofiber
HHV	Higher heating value
h-MWNT	Herringbone concentric multiwall nanotube
HRTEM	High-resolution transmission electron microscopy
HT	High temperature
ICDD	International Centre for Diffraction Data
IGA	Intelligent gravimetric analyzer
IR	Infra-red
IUPAC	International Union Pure and Applied Chemistry
JCPDS	Joint Committee on Powder Diffraction Standards
LCVD	Laser-assisted thermal chemical vapour deposition
LHV	Lower heating value
LNG	Liquefied natural gas
LO	Longitudinal optical
MARE	Mean absolute relative error

MSB	Magnetic suspension balance
MSD	Mean-squared deviation
MWNT	Multiwalled nanotube
<i>n, m</i>	Topological characterization of a nanotube by the chiral vector nm , where n and m span the graphite lattice
NCD	Nanocrystalline diamond
NGCC	Natural gas combined cycle
NGV	Natural gas vehicle
NIST	National Institute of Standards and Technology
OA	Orthogonal array
PEM	Proton exchange membrane
PETRONAS	Petroleum Nasional Berhad
PSD	Pore size distribution
QC	Quality characteristic
RBM	Radial breathing mode
RE	Renewable energy
SAED	Selected area electron diffraction
SEM	Scanning electron microscope
SET	Single electron tunneling
SI	Severity index
SNR	Signal-to-noise ratio
SPM	Scanning probe microscopy (includes STM, AFM, etc.)
SREP	Small Renewable Energy Power Programme
SWNT	Single walled nanotubes
TEM	Transmission electron microscopy
TGA	Thermogravimetric analysis
TISO	Two-Input-Single-Output
TO	Transverse optical
UHV	Ultra high vacuum
UV	Ultra violet
VOC	Volatile organic compound
VPSEM	Variable pressure scanning electron microscope
VSEM	Virtual scanning electron microscope
XRD	X-ray diffraction
